The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro

The VK sequence is one of seven (AAR21286-92) found to be expressed from a single chain FV library from an immunised mouse. The library reproduces a diverse reperfoire of antibody fragments specific for 2-phenyl-5-oxazolone (phox). It was prepd. using cDNA generated albumin. The VH and VL Kappa sequences were separately amplified by PCR (see AAQ23474-84) and ligated into fdCAT2 (see AAQ23463) for expression on the phage surface as fusions with gene III. The resulting line library of clones was diverse. Twenty three hapten binding clones were sequenced revealing eight different VH genes (A-H) (see AAR21264-71) in a variety of palrings with the seven different VK genes (a-g). Of the twenty three clones sequenced, four were of type "e", and were "ox-like" genes. (See Berek et al, Nature 316 412-418, 1985). They contain the DXGXX motif in CDR3, the central Colones were Vk-d combinations. The Kd of VH-B/VK-b for phox-GABA was 10 uM, one of the highest values found. This suggests that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ex-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This suggests that phage bearing scFv fragments having weak affinities can be selected with antigen, probably due to the avidity of the multiple antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing members of specific binding pairs - by expression in recombinant host cells with a secreting replicable genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 108;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 FSGSGSGTSYSLTISRMEAEDAATYYCQQRSSYPFTFGSGTKLEIK 106

The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro

```
TYPE: PRT
OKCANISM: Artificial Sequence
FEATURE:
NAME/KEY: Humanized COL-1 VH, HuVHAA
LOCATION: 1..124
COTHER INFORMATION: Humanized heavy chain variable region containing human
OTHER INFORMATION: WERS, muxine COL-1 VH CDRs, and Ala-24, Phe-27, Asn-28,
COTHER INFORMATION: IE-29, Lys-30, Ala-79, Asn-97, and Thr-98
Sequence 6, Application US/09974052

Sequence 6, Application US/09974052

Patent No. US20020165387A1

SERBRAL INFORMATION:

APPLICANT: Anderson, W.H. Kerr

APPLICANT: Tempest, Philip R.

APPLICANT: Haris, William J.

APPLICANT: Harris, William J.

APPLICANT: Howering Nathryn

TITLE OF INVENTION: High Affinity Humanized Anti-CEA Monoclonal Antibodies

CURRENT APPLICATION NUMBER: US/09/974,052

CURRENT FILING DATE: 1996-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/029,694

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                      Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor,
                                                                                                                                                                               New immunoglobulin molecules are described that bind kinase insert domain-containing receptor (KDR) with a comparable affinity to human vascular endothelial growth factor (VEGF). The antibodies neutralise KDR activation. The immunoglobulin may be a multivalent single chain antibody, a monovalent single chain antibody, a diabody, a triabody, a humanised antibody or a chimerised antibody, a finencial lamunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as VEGF. Overexpression of VEGF has been implicated in a number of human tumogur cell lines including glioblastoma multiforme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0; Gaps

The present sequence is that of the light chain variable region of IMC-1C11, a mouse-human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-angiogente molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-1C11. Conditions that can be treated include a neoplasm, a collagen vascular disease or an autoimmune disease, carcinoma, prostate carcinoma, colon carcinoma, lung carcinoma, prostate carcinoma, covarian carcinoma, neuroblastoma multiforme or melanoma (all claimed).

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which can estably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) indicated to the N terminus of immunoglobulin (Ig) catical coated to the N terminus of the CH1 domain. (I) is useful for:

CC site located to the N terminus of the CH1 domain. (I) is useful for:

CC site located to the N terminus of the CH1 domain. (I) is useful for:

CC site located to the N terminus of the CH1 domain. (I) is useful for:

CC reducing endothelial call proliferation; inhibiting angiogenesis;

CC reducing endothelial cell proliferation; inhibiting vEGF induced

CM ingration of human leukaemia cells; blocking interaction of a protein and can size in the design of (1) provides for efficient production so that

CC and in vivo and in vitro for investigative, diagnostic or treatment combinated are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous cond in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural continue containing a heavy chain variable domain. (VH) incorporated into Fv, an engineered protein containing a heavy chain variable domain containing the marked the complex processor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó
                                                                                                                                                                                                                                                                                                                          New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: clare to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vacular endothelial growth factor (VEGF) receptor: reducing tumour growth; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the FC region (e.g., CH2 and CH3 for an IgG molecule) of a natural continuous and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the campiete product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides  \  \, .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ), an engineered protein containing a variable light and variable domain on one polypeptide, described in the method of the \,

                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel cell-targeting vector (A) containing a DNA sequence (I) encoding a single-chain variable antibody fragment (SCEV). The products of the invention have antiviral, cytostatic and immunostimulant activity and can be used in gene therapy, immunization and diagnosis particularly of T cell-associated diseases, specifically cand diagnosis particularly of T cell-associated diseases, specifically control of the CD4 receptor, with high selectivity, 4-5 fold selectivity over the CD4 receptor, with high selectivity, 4-5 fold selectivity over cheman-(B cells, and 1000 fold selectivity) over other human cells. A vector designated 7A5 encodes a 329 amino acid single-chain variable antibody fragment, fully defined in the specification. It was used to transform CC (SNV), cells (Muman T lymphocyte) cells, and Hela (Human cervical carcinoma) cells. After 48 hours, the cells were stained with X-gal to determine transformation. The viral titer (infectious units/ml) was over a million for D17, in million for CB166 but less than 100 for HeLa, showing the high selectivity for human T cells. This sequence represents the SNV-env leader/human 7B2-scrv fusion construct used in the invention.
                                                                                                                                                                                                                                                                                                                                                        T lymphocyte; antibody; single chain variable antibody; scFv; human; cell-targeting vector; antiviral; cytostatic; immunostimulant; AIDS; gene themapy; immunisation; diagnosis; T cell-associated disease; SCID; acquired manune deficiency syndrome; severe combined immune deficiency; T cell lymphoma; fusion construct.
Cell-targeting vector selective for T lymphocytes, useful in gene therapy of e.g. acquired immune deficiency syndrome, encodes a single-chain variable antibody fragment .
                                                         SNV-env leader/human 7B2-scFv fusion construct.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VBGFR) in manmals particularly humans. The method involves treating the mammals with humanised VBGFR monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse available region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is humanised antibody light chain fragment used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; light chain; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; mouse; human; chimeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting growth of non-solid tumor cells useful to treat bone marrow
                                                                                                           tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -

the method of the invention.

```
The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) (Ig) (Ight chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: Site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis, creducing endothelial coll proliferation; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; creducing endothelial coll for investigative, diagnostic or treatment cand in vivo and in vitro for investigative, diagnostic or treatment cand in vitro for investigative, diagnostic or treatment cand in vitro for investigative, diagnostic or treatment constitute constitute constitute configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute configuration (ECC) the configuration. (I) is bivalent and bispecific, and in tetrameric form. The heavy chain constant domains which constitute configuration or provessing in vitro to obtain the complete product. This sequence represents a light chain variable domain wariable domain and a light chain variable domain in one polypeptide chain, and a light chain variable domain in one polypeptide chain, and a light chain variable domain in one polypeptide chain, and in the complex constitute and a light chain variable domain in one polypeptide production.
                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies
                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; light chain; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; chimeric; human; plCll vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                         ö
               variable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) graffed into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic myelocytic leukaemia, acute or chronic myelocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to mon-Hodgkin's and Hodgkin's Alsease. The present sequence is chimeric picli light chain fragment which is used for the construction of chimeric picli light chain contains choned variable light chain (VL) and human kappa light chain constant region
(antagonists). Humanised monoclonal antibody comprises humanised mouse
                                                                                                                                                                                                                                                                                                                                                         Gaps

The present sequence is that of the light chain variable region of IMC-1C11, a mouse-human chimeric antibody that has vascular conditionalial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as a nati-antiogenic molecule, together with a chemotherapeutic acid, for the treatment of an antiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent.

The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-1C11. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a soil tumour, including breast carcinoma, lung especially a soil tumour, including breast carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (PI) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. PI has an antigen-binding site located to the N terminus of immunoglobulin (Ig) is useful for: antigen-binding stee located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis, reducing endothelial cell proliferation; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins production so that substantially all of the antigen-binding proteins production so that the desired configuration. (I) is bivalent and bispecific, homogeneous of in the desired configuration. (I) is bivalent and bispecific, antibody and which provide other antibody functions can be present. There the FC region (e.g., CH2 and CH3 for an IgG molecule) of a natural configuration containing a variable light and variable fragment (C Fh1s is the amino acid sequence of a single chain variable light and variable homes the complete processing in the method of the configuration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                  New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          regions of the single chain variable fragment protein. from a single chain Fv library from an immunised mouse. The libra-
from a single chain Fv library from an immunised mouse. The libra-
ry produces a diverse repertoire of antibody fragments specific for
2-phenyl-5-oxazolone (phox). It was prepd. using cDNA generated
from man from mice immunised with phox coupled to chicked serum
albumin. The VH and VL kappa sequences were separately amplified
by PCR (see AAQ2344-84) and ligated into fdCaT2 (see AAQ23463) for ex-
pression on the phage surface as fusions with gene III. The result-
ing library of clones was diverse. Twenty three hapten binding
clones were sequenced revealing eight different VH genes (A+H) (see
AAR21264-71) in a variety of pairings with the seven different VK
genes (a-9). Of the twenty three clones sequenced, four were of
typer (a-7) in a variety of pairings with the seven different VK
genes (a-9). They contain the DXGXX motif in CDR3, the central
cly of which is needed to reade a cavity for phox. Most of the
clones were VK-d combinations. The Kd of VH-BVK b for phox-GABA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hoogenboom HRJ, Griffiths AD;
Clackson TP, Chiswell DJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           clones were Vk-d combinations. The Kd of VH-B/Vk-b for phox-GABA was \frac{1}{10}0 uM, one of the highest values found. This suggests that phage bearing scFv fragments having weak affinities can be selected with antigen, probably due to the avidity of the multiple antibody
                                                                                                                                                            Fd; bacteřlophage; gene III; filamentous; phagemid; capsid; coaplus; g3p; binding; adsorption; gene VIII; diverse repertoire; specific plading pairs; replicable genetic display package.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing members of specific binding pairs - by expression in recombinant host cells with a secreting replicable genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is the light chain variable region of the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro
                                                                                                                                                                                                                                                                                                                                                     Anti-CEA antibody; carcinoembryonic antigen; 806.077 Ab; cancer therapy; cancer diagnosis; complementarity determining region; light chain.

Novel single chain antibody molecule specifically recognizing common mutant epitope in mutant p53 but not in wild-type p53, and polynucleotides encoding antibodies, useful for preparing medicament
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               epitope peptide. Gene segments encoding the antibody heavy and light chain variable regions were amplified by PCR from the spleen obtained. When the genes isolated from the antibody genes was obtained. When the genes isolated from the antibody genes was subjected to panning, scFv DNA, expressed as phage antibodies and subjected to panning, scFv MEI was isolated, which possessed a significant affinity (0.1 uM) towards mutant p53. MEI was successfully expressed as a soluble antibody, separate from the phage fusion. MEI, DNA encoding if (see AAH26790-91) and a vector comprising the DNA, are used in claimed methods for treating a patient suffering from a disease related to mutation of the p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of a single chain antibody (scFv), designated MEI, which specifically recognises the common mutant epitope (see AAB82900) in mutant p53 protein but not in wild-type p53. To obtain the scFv, mice were immunized with the mutant p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                /label= CDR3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is the light chain variable region of the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro
                                                                                                                                                                                   Anti-CEA antibody; carcinoembryonic antigen; 806.077 Ab; cancer therapy; cancer diagnosis; complementarity determining region; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

gene, especially cancer. scfv MEI serves as a powerful auxiliary agent capable of specifically enhancing the specificity and effectiveness of the two major existing anti-cancer gene therapies. Expression of the serv MEI molecules as an intrabody fused to the Expression of the serv MEI molecules as an intrabody fused to the degradation cascade may be capable of significantly reducing the level of mutant p53 in the cell, thereby broadening the range of possible tumour targets for the original therapy. The substitution of the original antibody by the scfv MEI specific to the mutant form of p53 may restrict the therapeutic effect to cancer cells only, allowing a systemic application of this therapy. MEI continuity and mad mas high permeability in the cells, and thus is a suitable probe for immunodiagnostic clinical detection of mutant is b53 in tissues using conventional immunohistochemistry techniques.

                                                                     Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor, used to reduce tumour growth
                                                                                                                                                                            New immunoglobulin molecules are described that bind kinase insert domain-containing receptor (KDR) with a comparable affinity to human vascular endothelial growth factor (VEGF). The antibodies neutralise KDR activation The immunoglobulin may be a multivalent single chain antibody, a monovalent single chain antibody, a diabody, a triabody, a monovalent single chain antibody, a diabody, a triabody, a humanised antibody or a chimerised antibody, a diabody, a triabody, a humanised antibody or a chimerised antibody. The immunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, hemangioblastoma, central nervous system neoplasms and AIDS associated Karposi's sarcoma. The antibodies therefore have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) is useful for:

1 ight chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CHI domain. (I) is useful for:

1 centralising the activation of a vascular endothelial growth factor.

2 (VEGF) receptor: reducing tumour growth; inhibiting vEGF induced myration of human leukaemia cells; blocking interaction of a protein and instration of human leukaemia cells; blocking interaction of a protein and invivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the FC region (e.g., CH2 and CH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a heavy chain variable domain (YH) incorporated the provider of the antiger than the domain the complete broader.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         into Fv, an engineered protein containing a heavy chain variable domain and a light chain variable domain in one polypeptide chain, described in the method of the invention.
New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antigen-binding protein; single chain variable fragment; scFv; antigen; cytostatic, angiogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 QVKLQQSGAELVGSGASVKLSCTTSGFNIKDFYMHWVKQRPEQGLEWIGWIDPENGDSGY 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ΩŽ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis; reducing endothelial cell proliferation; inhibiting vEGF induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the Er region (e.g., CH2 and CH3 for an IgG molecule) of a natural antibody and which provide other antibody functions can be present. There have is the amino acid encounted the complete product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                      New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides \cdot

The invention relates to a method for inhibiting the growth of non-solid tumour cells that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves treating the mammals with humanised VEGFR monoclonal antibodies
Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; heavy chain; myelocytic leukaemia; lymphocytic; erythrocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; mouse; human; chimeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (antagonists). Humanised monoclonal antibody comprises humanised mouse variable region joined to human constant region, where the humanised mouse variable region ontains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is humanised antibody heavy chain frgament used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The antibody, or a fragment of it, can be used as an anti-angiogenic molecule, together with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition in administering an anti-angiogenic molecule and a chemotherapeutic agent, to produce a regression or arrest of the condition while minimising or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially INC-1211. Conditions that can be treated include a neoplasm, a collagen vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, ovarian carcinoma, neuroblastoma, central nervous system tumour, neuroblastoma, glioblastoma multiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating or controlling an angiogenic dependent condition (e.g. neoplasm, collagen-vascular or autoimmune disease) in mammal by administering a combination of an antiangiogenic molecule and a

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor: reducing tumour growth; inhibiting vegf induced migration of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute and in tetrameric form. The heavy chain constant domains which constitute antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a heavy chain variable domain (VH) incorporated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an engineered protein containing a heavy chain variable domain jht chain variable domain in one polypeptide chain, described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
cytostatic; angiogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present sequence is that of the heavy chain variable region of IMC-1C11, a mouse-human chimeric antibody that has vascular endothelial growth factor (VBGF) antagonist activity. The antibody, orr a fragment of it, can be used as an anti-anglogenic molecule, together with a chemotherapeutic acid, for the treatment of an

angiogenic dependent condition in a mammal, especially a human.

The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an antiogenic molecule and a chemotherapeutic agent, to produce a carest of the condition while minimising or preventing significant toxicity of the chemotherapeutic agent.

The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-IC11. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease, especially a solid tumour, including breast carcinoma, lung carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, covarian carcinoma, neuroblastoma multiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antigen-binding protein; single chain variable fragment; svFv; antigen; cytostatic; anglogenesis inhibitor; tumour; leukaemia; antibody; vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     regions of the single chain variable fragment protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                        The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) antigen-binding site located to the N terminus of immunoglobulin (Ig) is useful for:

CC light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for:

CC site located to the N terminus of the CH1 domain. (I) is useful for:

CC site located to the N terminus of the CH1 domain. (I) is useful for:

CC site located to the N terminus of the CH1 domain. (I) is useful for:

CC station for the name leavening two substantial and interaction of a protein and its ligadid; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment completent production so that methods from design of (I) provides for efficient production so that the desired configuration. (I) is bivalent and bispecific, homogeneous of in the desired configuration. (I) is bivalent and bispecific, homogeneous continued experiment for provide other antibody functions can be present. There is no regularement for provide other antibody functions can be present. There is no regularement for processing in vitro to obtain the complete product. This is the amino acid sequence of a single chain variable fragment (SPSY), the mediane protein containing a variable light and variable fragment for processing in the method of the survey.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vasculiar endothelial growth factor receptor; VEGFR; antagonist; tumour; vertostatic; heavy chain; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; Hodgkin's disease; chimeric; human; plCl1 vector.
                                                      New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The method involves treating the mammals with humanised VEGER monoclonal antibodies (antagonists). Humanised monoclonal antibody comprises humanised mouse (antable region joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating leukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgkin's and Hodgkin's disease. The present sequence is chimeric plul heavy chain fragment which is used for the construction of chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                p1C11 IgG expression vector. Chimeric p1C11 heavy chain contains cloned variable heavy chain (VH) and human IgG1 (gamma) heavy chain constant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 10
AAW28491
```

```
The p53 variants are more active and more stable tumour suppressors and apoptosis-inducing agents than wild-type p53 and are active where the wild-type protein is not, i.e. they are not inactivated by dominant negative or oncogenic mutants, nor by other cellular proteins (because
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligomerisation domain deleted and replaced by a leucine zipper domain. The mutants preferably also have at least part of the p53 transactivation domain (amino acids 1-74) deleted and replaced by the transactivation domain (TD) from herpes simplex virus viral protein vpi6 (amino acids 411-40) or by a protein domain able to bind selectively to a transactivator, especially a single-chain antibody variable domain (ScFv). The present sequence is that of a specifically claimed p53 variant designated 8.325 and morphisms a ScFv domain, amino acids 75-325 of human wild-type p53 (but with a Arg182 replaced by His) and a leucine zipper domain at the C-terminal.
                                        Leucine zipper domain; LZD; oligomerisation domain; mutant; mutein; substitution; replacement; transactivation; viral protein VPIG; HSV; anti-oncogene; hyperproliferation; cancer; restenosis; SCFV; tumour suppression; apoptosis; single chain antibody variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New p53 variants e.g. with oligomerisation domain replaced by leucine zipper - useful for treating hyper-proliferative disorders,
                                                                                                                                                                                                                                                                                           /note= "Arg residue at position 182 of wild-type p53 has been mutated to His"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            claimed variants of protein p53 have at least part of the oligomerisation domain deleted and replaced by a leucine zipper domain. The mutants preferably also have at least part of the p53 transactivation domain (amino acids 1.74) deleted and replaced by the transactivation domain (TD) from herpes simplex virus viral proferant VPIG (amino acids 411-49) or by a protein domain able to bind selectively to a transactivator, especially a single-chain antibody variable domain (ScFv). The present sequence is that of a specifically claimed p53 variant designated S-325 and comprising a ScFv domain, amino acids 75-325 of human wild-type p53 and a leucine zipper domain at the C-terminal. The p53 variants are more active and more stable tumour suppressors and apoptosis-inducing agents than wild-type p53 and are active where the wild-type protein is not, i.e. they are not inactivated by dominant negative or oncogenic mutants, nor by other cellular proteins (because the leucine zipper comain prevents formation of inactive mixed oligomers).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ĥ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses a method for the treatment of systemic lupus erythematosus (SLE) by down-regulating the autoimmune response to the c-terminal DNA-binding domain of p53 protein by an active compound. The present sequence is a heavy chain variable region of monoclonal antibody PND-421 which is specific to the C-terminal DNA-binding domain of mutine p53 protein. PAD-421 antibody and peptides based on complementarity determining regions of light and heavy chain variable regions of the antibody, are examples of active compounds useful in the diagnomis, prevention and treatment of SLE in humans.

                                                                                                                                                                                                                                      é
```

NAME OF THE PROPERTY OF THE PR

```
The present sequence represents a single chain antibody (ScFv) designated 421. The antibody binds to an epitope present in the C-terminal region of the p53 protein that includes oligomerisation and regulatory domains, specifically between positions 320 and 393. ScFv 421 is directed against p53 mutants, particularly H273, W248 and G281 mutants. When the ScFv is tirroduced into containing a mutant p53 protein, p53 dependent trans-activating activity is restored. ScFv 421 is specific for p53-mutants that have lost tumour-suppressing activity and are present in tumour cells. It is particularly used to treat hyper-proliferation associated with these mutants (e.g. cancer and re-stenosis) but may also be used in vitro for studying mechanisms of activity of p53 or its mutant and to purify or detect p53.
                                                                                                                                                          Single chain antibody; ScFv 421; mouse; p53 protein; oligomerisation; regulatory domain; p53 mutant; H273; W248; G281; p53-dependent trans-activating activity; restoration; treatment; tumour-suppressing activity; tumour cell; treatment; hyper-proliferation; cancer; re-stenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

22-AUG-1997 (first entry)

```
The present invention describes the use of an immunogen (A) to induce anti-tumnour immunity; to elicit an increased immune response to tumnour associated antigen (TAA) and/or to induce an immune response to mutant or wild-type forms of TAA in mammals. (A) is: (i) a monoclonal antibody (MAb) to TAA, or its fragment; (ii) a peptide based on a CDR (complementerity determining region) on the heavy or light chain of MAb (able to elicit antibodies to TAA); or (iii) a DNA that encodes the variable (V) region of MAb, in a gene delivery vehicle. The present sequence represents the variable heavy chain sequence from anti-p53 MAb (al. Also described is a method for generating sequence specific, anti-DNA antibodies (Ab) by immunising a mammal with a MAb directed to a commin containing a DNA-binding site of a DNA-binding protein. (A) is used to treat a wide variety of primary and metastatic cancers, condensing a man other language of primary and metastatic cancers, condensing and other parasites; to determine parentage; in forensic science; to isolate specific genes for DNA vaccination; in gene sequencing and cloning; also possibly for activation of selected thrappeutic genes in plants, animals and humans. (A) induce an effective anti-tumour response without causing harm to the patient. The method uses (A) to generate anti-TAA by exploiting the anti-idiotype network.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1; Gaps

The sequence was derived from RNA isolated from mouse hybridoma cells. The protein can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy metals in biological and inanimate systems. It can be used in e.g. aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials for electronic components. The products can provide for applications involving minute amounts of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Sequence 12, Application US/08434000A

Patent No. 6046037

GENERAL INFORMATION

APPLICANT: ANDREW C. HIATT, JULIAN

APPLICANT: K.-C. MA, THOMAS LEHNER

TITLE OF INVENTION: IMMUNOGLOBULINS CONTAINING PROTECTION

TITLE OF INVENTION: PROTEINS IN PLANTS AND THEIR USES

NUMBER OF SEQUENCES: 19

CORRESPONDENCE ADDRESS:

ADDRESSEE: Lyon & Lyon

STREET: 633 West Fifth Street

STREET: G31 Let 470

CITY: Los Angeles

STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 100.0%; Score 31; DB 2; Length 100; Best Local Similarity 100.0%; Pred. No. 4.3; Matches 7; Conservative 0; Mismatches 0; Indels

Sequence 61, Application US/09171945

Sequence 61, Application US/09171945

Patent No. 627759

GENERAL INFORMATION:

APPLICANT: Emery, Clive Graham

APPLICANT: Copley, Clive Graham

APPLICANT: Emery, Clive Graham

APPLICANT: Emery, Clive Graham

APPLICANT: Emery, Clive Graham

APPLICANT: Monoclonal Antibody to CEA, Conjugates Comprising Said

TITLE OF INVENTION: Antibody, and Their Therapeutic Use in an Adept System

TITLE OF INVENTION: Antibody, and Their Therapeutic Use in an Adept System

FILE REFERENCE: 1998-10-29

CURRENT FILING DATE: 1998-10-29

PRIOR APPLICATION NUMBER: GB9003405.7

PRIOR APPLICATION NUMBER: GB9003405.7

PRIOR APPLICATION NUMBER: POT/GB97/01165

PRIOR APPLICATION NUMBER: POT/GB97/01165

PRIOR APPLICATION NUMBER: POT/GB97/01165

SOFTWARE: PatentIn Ver. 2.1

SEQ ID NO 61

APPLICANT: Emery, Stephen
APPLICANT: Emery, Stephen
APPLICANT: Copley, Cilve Graham
APPLICANTON: Moncolonal Antibody to CEA
TITLE OF INVENTION: And Their Therapeutic Use in an Adept System
FILE REPERENCE: Monocolonal Antibody to CEA
CURRENT APPLICATION NUMBER: US/09/171,945
CURRENT APPLICATION NUMBER: CB99703103.3
PRIOR FILING DATE: 1997-02-14
PRIOR FILING DATE: 1996-05-04

                                                                                                                                                                                                                                      ó
This sequence represents a complementarity determining region (CDR) of the light chain of the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transpented organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therappy, selectively killing tumour cells. The antibody can be used for used for in vitro diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a complementarity determining region (CDR) from the heavy chain of the antibody of the invention. The antibody of the invention is a human CDR transplanted antibody that reacts specifically with ginglioside GM2. DNA encoding the antibody, and vectors and transformants containing it, can be used for the recombinant production of the fantibody. The antibody itself can be used as an anti-tumour agent or as a diagnostic tool for related cancers. The antibody has antitumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ganglios de GM2; antibody; complementarity determining region; cancer;

                                                                                                                                                                                                                                                                                                                                                                               AAW73170
```

```
The sequences AAY28390 to AAY28392 replace the CDR regions of the NEWM DNA and they produce AAY28394, the hKM796L human anti-GM2 antibody light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric human antibodies of the invention are useful in the treatment of cancer, especially that which is of neural ectodermal origin. In contrast to prior art constructs based on mouse monoclonal antibodies, the chimeric human antibodies do not cause anti-mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunoglobulin production. The chimeric human antibodies have a prolonged half-life and a reduced frequency of adverse effects when compared to mouse monoclonal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunoglobulin molecules are described that bind kinase insert domain-containing receptor (KDR) with a comparable affinity to human vascular endothelial growth factor (VEGF). The antibodies neutralise KDR activation. The immunoglobulin may be a multivalent single chain antibody, a humanised antibody in a chimnerised antibody, a diabody, a climnerised antibody, a diabody, a climnerised antibody. The immunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as C VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, hemangioblastoma, central nervous system neophasms and ALDS associated Karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes a preferred heavy chain complementary determining region of the immunoglobulins of the invention.
                                                                                                                                                                                                                                                                                                                                                                            Novel immunoglobulin molecules binding kinase insert domain-containing receptor with the same affinity as vascular endothelial growth factor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Acid-resistant microorganism; detection; faecal; intestine; infection; monoclonal antibody; light chain; complementarity determining region;

infection by an acid-resistant microorganism (A) by treating a faccal sample with at least two different monoclonal antibodies (MAb) (or their fragments or derivatives) or aptamers (collectively (I)) and detecting formation of a complex (C) between (I) and the corresponding antigen of formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens of (A). The first and second (I) bind to epitopes of different antigens of at least some mammals, and have either: (I) their native structure; or (ii) a structure against which an antibody is produced by an animal infection by acid-fast bacteria, particularly of the genera Helicobacter, or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H. Pylori, H. hepaticus, who therepensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This sequence represents a fragment of a H. Pylori 26 kba protein-binding antibody light chain complementarity determining region CDR2 which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                               Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a faecal sample with two binding reagents for antigens that survive intestinal passage -
                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for the detection of a mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor receptor; VEGFR; antagonist; tumour; cytostatic; light chain hypervariable region; VL; myelocytic leukaemia; lymphocytic; erythrocytic; monocytic; multiple myeloma; lymphoid cell; fodgkin's disease; complementarity determining region 2; CDR-2; mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Humanised antibody murine light chain hypervariable region (VL) CDR2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for inhibiting the growth of non-solid tumour ceils that are stimulated by a ligand of vascular endothelial growth factor receptor (VEGFR) in mammals particularly humans. The method involves Ereating the mammals with humanised VEGFR monoclonal antibodies (antagonists) Humanised monoclonal antibody comprises humanised mouse variable fegion joined to human constant region, where the humanised mouse variable region contains mouse complementarity determining region (CDR) grafted into human variable region. The method is useful for treating jeukaemias such as acute or chronic myelocytic leukaemia, acute or chronic lymphocytic leukaemia, erythrocytic or monocytic leukaemia, multiple myelomas and lymphoid cells, particularly those related to non-Hodgful's and Hodgful's and Hodgful's disease. The present sequence is humanised antibody murine light chain hypervariable region (VL) CDR-2 used in the exemplification of the invention.
                                                                                                                                                                                                                                                                              Inhibiting growth of non-solid tumor cells useful to treat bone marrow tumors such as leukemias or multiple myeloma comprises treatment with an antagonist of a vascular endothelial growth factor receptor -

NAME OF THE PROPERTY OF THE PR

```
The present sequence is that of complementarity determining region 2 of the light chain variable region (see also AAB82702) of 2 of the light chain variable region (see also AAB82702) of 2 of the light chain variable region (see also AAB82702) of 2 of MC-1011, a mouse-human chimeric antibody that has vascular endothelial growth factor (VEGF) antagonist activity. The antibody, or a fragment of it, can be used as an anti-angiogenic molecule, cogether with a chemotherapeutic acid, for the treatment of an angiogenic dependent condition in a mammal, especially a human. The invention relates generally to a method of treating or controlling an angiogenic dependent condition by administering an anti-angiogenic molecule and a chemotherapeutic agent. The preventing significant toxicity of the chemotherapeutic agent. The anti-angiogenic molecule inhibits or blocks the action of a vascular endothelium survival factor such as VEGF or its receptor, and is especially IMC-1011. Conditions that can be treated include a neoplasm, a collagen-vascular disease or an autoimmune disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ganglioside; GD2; complementation determining region; CDR; antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        especially a solid tumour, including breast carcinoma, lung carcinoma, prostate carcinoma, colon carcinoma, prostate carcinoma, ovarian carcinoma, neuroblastoma, central nervous system tumour, neuroblastoma, ultiforme or melanoma (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                            Treating or controlling an angiogenic dependent condition (e.g. neoplasm, collagen-vascular or autoimmune disease) in mammal by administering a combination of an antiangiogenic molecule and a chemotherapeutic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ganglioside GD2 specific antibody related peptide SEQ ID NO: 7.

Monoclonal antibody 2C4; sialoadhesin factor-2; SAF-2; allergic rhinitis; allergy; asthma; anemia; eczema; lymphoma; systemic mastocytosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel monoclonal antibody specific for human sialoadhesin factor-2 for diagnosis, prevention, treatment of allergy, asthma, eczema or diseases such as lymphoma, leukemia or systemic mastocytosis, in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAG63991-93 represent the complementarity determining regions (CDRs) of the light chain variable region of murine monoclonal antibody 2C4. This antibody binds to human sialoadhesin factor-2 (SAF-2). The antibody is useful for treating or preventing allergic rhinitis, allergies, asthma, anemia, eczema or diseases such as lymphoma, leukemia or systemic mastocytosis in a mammal. It is also useful for detecting the presence of a cell, especially eosinophil in a sample, by detecting binding of the antibody to SAF-2. The antibody can be coupled to toxins, antiproliferative drugs or radionuclides to kill cells in areas of excessive SAF-2 expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                        The present invention describes an antibody, which can react specifically with ganglioside GD2, and is transplanted with a human type complementation-determining domain (CDR), or its fragments. The antibody and its derivatives are useful in diagnosis and therapy of tumours, particularly cancer diagnosis. The present sequence is a peptide used in the exemplification of the invention.
                                                                                                                                              Human type complementation-determining domain transplanted antibody and derivatives against ganglioside GD2, useful in diagnosis and therapy of e.g. tumours, has low antigenicity, little side effects but potent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to derivatives of an antibody against agaquicaide GMZ. The antibody may be a monoclonal antibody or its fragments. The antibody is combined with a radioactive isotope, protein or small drug in the treatment and diagnosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Monoclonal antibodies against ganglioside GM2 combined with drugs, radioisotopes or proteins for treatment and diagnosis of cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an anti-trkC agonist monoclonal antibody which shows no significant cross-reactivity with trkA or trkB, and recognizes an epitôpe in domain 5 of trKC. The antibodies of the invention are effective in the treatment of cisplatin- or pyridoxine-induced neuropathy, peripheral neuropathy, diabetic neuropathy and large-fibre sensory meuropathy, neurodegenerative disease including amyotrophic lateral sclerosis, nerve cell injuries, disorders of insufficient blood cells such as leukopaenia including eosinopaenia, basopaenia, lymphopäenia, monocytopaenia, neutropaenia, Alzheimer's disease, Parkinsön's disease, muntington's disease and tumours. The sequences are also useell for inducing angiogenesis for treating wounds, ulcers and diabetic complications of sickle cell disease, for treating cardiac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diabetic complications of signatures. It is trained with the diagnosis of diseases is the diagnosis of diseases involving cellular degeneration. Sequences AAU81229-AAU81284 represent human and mouse anti-trKC agonist monoclonal antibodies and antibody fragments of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel and 1-trkC agonist monoclonal antibody useful for treating neurodegenerative disease, shows no significant cross-reactivity with trkA/trkB, and recognizes epitope in domain 5 of trkC

The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. Pl has an antigen-binding site located to the N terminus of immunoglobulin (Ig) (Ight chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of immunoglobulin (Ig) (Ight chain constant domain (CL domain), and P2 has an antigen-binding constant domain to day associate and proving the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting angiogenesis, constrain of human leukaemia cells; blocking interaction of a protein and its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment continued continued in the design of (I) provides for efficient production so that substantially all of the antigen-binding proteins production so that cand in tetrament form. The heavy chain constant domains which constitute the Er region (e.g., CH2 and CH3 for an IgG molecule) of a natural cantibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides
                                                                                                                                                                    Complementarity determining region, CDR; CDRL2; antigen; cytostatic; angiogenesis inhibitor; vascular endothelial growth factor receptor; VBGF; tumour; leukaemia; antibody; cell proliferation inhibitor; antibody light chain variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           complementarity determining region L2 (CDRL2) incorporated into an antigen-binding protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This peptide sequence represents the light chain variable domain complementarity determining region L2 (CDRL2) incorporated into a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel heavy chain and light chain polypeptides or their fragments of a recombinant antibody to human TWR-alpha which contain complementarity determining region (CDR) sequences. The products of the invention have vasotropic, antiarchic, neuroprotective and protozoacide activity. The antibodies act by neutralising TWR-alpha in vivo. The antibodies are used for producing chimaric and humanised antibodies that may be used for the treatment and prevention of TWR-alpha associated diseases such as toxic shock syndrome, rheumatoid arthritis, malaria and multiple sclerosis. The antibodies have low immunogenicity in humans. This sequence represents the anti-human tunnour necrosis

NAME OF THE PROPERTY OF THE PR

```
The present invention describes the use of an immunogen (A) to induce anti-tumour immunity; to elicit an increased immune response to tumour associated antigen (TAA) and/or to induce an immune response to tumour associated antigen (TAA) ind/or to induce an immune response to mutant or wild-type forms of TAA in mammals. (A) is: (I) a monoclonal antibody (MAb) to TAA, or its fragment; (ii) a peptide based on a CDR (complementarity determining region) on the heavy or light chain of MAb (able to elicit antibodies to TAA); or (iii) a DNA that encodes the variable (V) region of MAb, in a gene delivery vehicle. The present sequence represents the variable light chain sequence-from anti-p53 MAb 246. Also described is a method for generating sequence-specific, anti-DNA antibodies (Ab) by immunising a mammal with a MAb directed to a noti-DNA antibodies (Ab) by immunising a mammal with a MAb directed to a companion containing a DNA-binding site of a DNA-binding protent. (A) is used to treat a wide variety of primary and metastatic cancers, particularly those where p53 is involved. Ab are used for diagnosis (e.g to determine critical sequences in animmal or plant breeding); to identify bacteria and other parasites; to determine parentage; in forensis cachence; to isolate specific genes for DNA vaccination; in gene sequencing and cloning; also possibly for activation of selected therapeutic genes in plants, animmals and humans. (A) induce an effective anti-tumour response without causing harm to the patient. The method uses (A) to generate anti-TAA by exploiting the anti-idiotype network.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of a monoclonal antibody to a tumour-associated antigen - to induce anti-tumour immunity or elicit an increased immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) in the specification). ABN15762 to ABN27252 encode the human ORFX proteins are useful for treating or preventing a pathology associated with an ORFX postated for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome (associated with ORFX-associated disorder. ORFX polynucleotide syndrome (associated in gene therapy. ORFX sequences can be used in the treatments of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, hemorrhage, osteoarthitis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, and the manument of ficiencies and disorders, infectious storage diseases, various immune deficiencies and disorders, rheumatoid arthritis, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune infammatory eye disease. ORFX proteins are also more, if the properties of the part of th
cardiovascujar disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; fimune defficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; myasthenia gravis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfugion injury in various tissues and conditions resulting from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Db
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                              Sequence 76, Application US/09144886
| Patent No. US2002155114A1
| GENERAL INFORMATION:
| APPLICANT: Marks, James D
| APPLICANT: Amersdorfer, Peter
| TILE OF INVENTION: Therapeutic Monoclonal Antibodies That Neutralize
| TILE OF INVENTION: Detailnum Neurotoxins
| FILE REFERENCE: 2500.117050
| CURRENT APPLICATION NUMBER: US/09/144,886
| CURRENT FILING DATE: 1998-08-31
| NUMBER OF SEQ ID NOS: 98
| SOFTWARE: PatentIn Ver. 2.0
| SEQ ID NO 76
| LENGTH: 107
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

US-09-910-059-65

Sequence 65, Application US/09910059

Sequence 65, Application US/09910059

Patent No. US200201423591

GENERAL INFORMATION:

APPLICANT: George, Michael Derek

APPLICANT: George, Michael Derek

APPLICANT: George, Michael Derek

APPLICANT: George, Michael Derek

TITLE OF INVENTION: Monoclonal Antibody to CEA, Conjugates Comprising Said Antibody,

TITLE OF INVENTION: Their Their Theoremic use in an Adept System

TITLE OF INVENTION: WOMBER: US/09/910,059

CURRENT APPLICATION NUMBER: US/09/910,059

CURRENT FILING DATE: 1998-10-29

PRIOR PELLING DATE: 1998-10-29

PRIOR APPLICATION NUMBER: CE 9703103.3

PRIOR PELLING DATE: 1997-02-14

PRIOR FILING DATE: 1997-02-14

PRIOR FILING DATE: 1996-05-04

NUMBER OF SEQ ID NOS: 131

SEQ ID NO 65
